The Photline DR-PL-10-MO RF drivers are amplifiers module designed to drive LiNbO_3 optical modulators so as to generate undistorted optical pulses.

Electrical pulsed signals differ from classical telecom signals by long periods with no signal, when telecom signals are usually well balanced in 1 and 0. They also differ from analog signal by a wider frequency content. In order to generate clean optical pulses with sharp edges, sustained high and low levels and no overshoot, pulsed signals do require specific amplifiers.

The Photline DR-PL-10-MO driver is optimized for low and high Pulse Repetition Frequency (PRF) signals from 10 Hz to GHz. The bandwidth up to 10 GHz accommodates 100 ps narrow pulse width with short rise and fall time (down to 25 ps) and can withstand longer pulses up to 100 ns.

The Photline DR-PL-10-MO drivers come in compact connectorized modules that match directly with Photline modulators, they use a single voltage power supply for ease and safety of use and feature an output voltage control for maximum flexibility. An optional heat sink is proposed as an accessory.

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.
