ModBox-VNA-780nm-40GHz

780 nm, 40 GHz Modulation Unit

The ModBox-VNA-780nm-40GHz is a wide bandwidth Optical Transmitter designed to extend Vectorial Network Analyzers applications into the optical domain.

When associated with a Vectorial Network Analyzer, they make up a high performance and easy to use test equipment for photoreceivers or any high speed optoelectronic device characterization.

The ModBox-VNA-780nm-40GHz incorporates a 780 nm low noise laser source and a modulation stage based on a wide bandwidth $LiNbO_3$ analog modulator with an automatic bias control circuit.

FEATURES

- Analog modulation up to 40 GHz
- Low RIN
- High harmonics suppression

APPLICATIONS

- Transmission system test
- Components characterization
- Receiver frequency test
- R&D laboratories

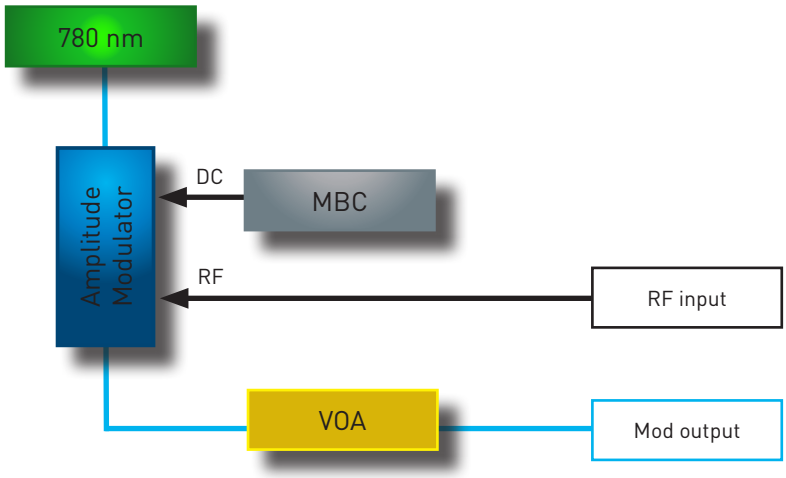
FUNCTIONAL BLOCK DIAGRAM



The ModBox-VNA-780nm-40GHz features:

• A chirp-free X-cut $LiNbO_3$ (Lithium Niobate) Mach-Zehnder modulator for very high linearity and very wide electro-optical bandwidth.

• A modulator bias controller. The internal $LiNbO_3$ modulator is a X-cut device with very low drift. However an automatic bias control circuit is provided to lock the operating point of the modulator at the quadrature point whatever the environmental conditions. It is pre-set for operation in quadrature, in the linear portion of the modulator transfer curve.

• A 780 nm low RIN laser. Wavelength and power are tunable through the front panel controls or the ModBox software interface.

• A Variable Optical Attenuator (VOA) to precisely control the modulated optical outpul signal.

The ModBox-VNA-780nm-40GHz is controlled from the front panel thanks to the Graphical Interface (Windos OS).
It comes also with a set of TCP commands for remote control through the Ethernet port.

INPUT ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Condition	Min	Typ	Max	Unit
Input electrical termination	-	AC coupled		Single ended		
Signal type	-	-		Analog		
Input voltage [1]	V_{IN}	Amplitude modulation	0.4	0.6	1	Vpp

(1): The ModBox-VNA-780nm-40GHz does not feature an internal RF amplifier. The VNA characterization is usually performed in a "small signal mode", therefore a RF amplifier is not necessary. Omitting the amplifier allows to obtain a smoother and flatter transfer function.
